

PRACTICAL 3

Aim:

To design and develop an intelligent **Movie Series Rating and Social Interaction Application** that enables users to discover, rate, match, and discuss movies and series using AI-driven recommendations, social compatibility analysis, and interactive features.

Questionnaires:

1. What is the primary objective of the Movie Series Rating Application?
2. What challenges do users face while discovering movies and series manually across multiple platforms?
3. Who are the primary users of this system? (Students, movie enthusiasts, content creators, casual viewers, etc.)
4. What core functionalities should the system provide? (Watchlist, ratings, notes, recommendations, social interaction, etc.)
5. How should the system categorize movies and series? (Genre, language, mood, popularity, release year, etc.)
6. Should the system support personalized recommendations based on viewing history and preferences?
7. How should the compatibility feature work between users? (Taste similarity, favorite genres, ratings overlap, etc.)
8. What information should be stored for each user profile? (Favorite movies, ratings, watchlist, socials, tags, etc.)
9. How should the Movie Tinder feature function? (Swipe-based liking/disliking, instant suggestions, matches, etc.)
10. How should the system implement Buzz Search for trending movies and series?
11. How should user authentication and privacy be handled?
12. What AI techniques or recommendation models should be used?
13. Are there any future features planned? (Watch parties, AI reviews, sentiment analysis, etc.)
14. Do you have any design preferences for the user interface? (Minimal, dark mode, poster-focused UI, etc.)
15. How should the system scale to support a large number of users and real-time interactions?

Record Review:

Project Title: MovieVerse – An Intelligent Movie & Series Rating and Social Discovery Platform

Review Focuses on:

Existing movie platforms such as IMDb, Letterboxd, Rotten Tomatoes, and streaming recommendation systems were studied. While these platforms provide ratings and reviews, they lack deep social interaction, compatibility-based matching, and engaging discovery methods like swipe-based movie selection.

Overview:

The MovieVerse project aims to build an intelligent movie and series discovery platform that combines **ratings, social interaction, AI-powered recommendations, and compatibility matching**. The system enables users to maintain watchlists, add notes or tags, connect with others, and discover content through innovative features such as Movie Tinder and Buzz Search.

Brain Stroming & Discussion:

Key Objectives:

The primary objectives of the URWA Research Bot project include:

1. **Personalized Discovery:**

The system should recommend movies and series based on user preferences, ratings, and watch history.

2. **Social Interaction:**

Users should be able to chat, follow others, share reviews, and connect via linked social media profiles.

3. **Compatibility Matching:**

The application should calculate compatibility between users based on favorite genres, ratings, and viewing patterns.

4. **Interactive Movie Tinder:**

A swipe-based interface should allow users to like or dislike movies for quick and engaging discovery.

5. **Buzz Search:**

The system should highlight trending, popular, and highly discussed movies and series in real time.

6. **Profile Customization:**

Users should be able to showcase 4–5 favorite films, series, and link 4–5 social media accounts.

7. Scalability and Performance:

The platform should efficiently handle multiple users, real-time chat, and recommendation processing.

Observation:

1. Users often struggle to find content that matches their taste across different platforms.
2. Existing platforms lack meaningful social compatibility analysis.
3. Manual tracking of watchlists and favorites is inefficient.
4. Movie discovery can become repetitive without intelligent recommendations.
5. Current systems focus more on ratings than user interaction.
6. There is limited use of AI-driven personalization in social movie platforms.
7. A unified platform combining discovery, social interaction, and AI is needed.
8. An intelligent movie rating application can significantly improve user engagement and satisfaction.
